Application No.: 10/598,767 Amendment under 37 CFR §1.116
Art Unit: 1793 Attorney Docket No.: 062888

AMENDMENTS TO THE CLAIMS

The listing of claims below replaces all prior versions of claims in the application.

1. (Currently Amended): A rapidly solidified material consolidated into a bulk form for actuators and sensors, comprising a Fe-Ga magnetostrictive alloy which is obtained [[from]] by plasma sintering slices, a powder or chops [[of]] comprising a Fe-Ga alloy rapidly solidified material by spark plasma sintering, the Fe-Ga alloy rapidly solidified material having a high temperature-side disordered bcc structure and a fine columnar texture by a liquid rapid solidification method, being in a disordered to ordered transition composition range, and containing 15 to 23 atomic percent of Ga with respect to polycrystalline Fe.

wherein the Fe-Ga magnetostrictive alloy retains the texture of the Fe-Ga alloy rapidly solidified material, and a magnetostriction of 170 to 230 ppm is obtained at room temperature by annealing after the sintering.

2-3 (Cancelled).

4. (Currently Amended): The rapidly solidified material consolidated into a bulk form for actuators and sensors, according to Claim 1, comprising a Fe-Ga magnetostrictive alloy which is obtained by plasma sintering slices, a powder or chops comprising a Fe-Ga alloy rapidly solidified material, the Fe-Ga alloy rapidly solidified material having a high temperature-side disordered bcc structure and a fine columnar texture by a liquid rapid solidification method,

Art Unit: 1793

Amendment under 37 CFR §1.116

Attorney Docket No.: 062888

being in a disordered to ordered transition composition range, and containing 15 to 23 atomic

percent of Ga with respect to polycrystalline Fe,

wherein the Fe-Ga magnetostrictive alloy retains the texture of the Fe-Ga alloy rapidly

solidified material, and a magnetostriction of 250 to 260 ppm is obtained at room temperature by

annealing in a magnetic field following the sintering.

5. (Withdrawn): A rapidly solidified material consolidated into a bulk form for actuators

and sensors, comprising a TiNiCu shape-memory alloy which is obtained from slices, a powder

or chops of a TiNiCu shape-memory alloy rapidly solidified material by spark plasma sintering,

the TiNiCu shape-memory alloy rapidly solidified material being composed of an amorphous to

nanocrystalline texture or an amorphous and nanocrystalline mixed texture by a liquid rapid

solidification method.

6. (Withdrawn): The rapidly solidified material consolidated into a bulk form for

actuators and sensors, according to Claim 5, wherein the TiNiCu shape-memory alloy is

 $Ti_{50+x}Ni_{40}Cu_{10-x}$ (where x is in the range of 0 to 4 on an atomic percent basis).

7. (Withdrawn): A method for producing the rapidly solidified material consolidated into

a bulk form for actuators and sensors according to Claim 1, comprising the steps of: forming a

rapidly solidified material by a liquid rapid solidification method from a Fe-Ga alloy having a

high temperature-side disordered bcc structure and a fine columnar texture, being in a disordered

to an ordered transition composition range, and containing 15 to 23 atomic percent of Ga with respect to polycrystalline Fe; forming slices, a powder, or chops from the alloy as a raw material; and performing spark plasma sintering of the raw material at an application pressure of 50 MPa or more and at a sintering temperature of 873K or more under conditions in which the pressure and the temperature are controlled so that the texture of the rapidly solidified material is not lost.

- 8. (Withdrawn): A method for producing the rapidly solidified material consolidated into a bulk form for actuators and sensors according to Claim 5, comprising the steps of: forming a TiNiCu shape-memory alloy rapidly solidified material which is composed of an amorphous to a nanocrystalline texture or an amorphous and nanocrystalline mixed texture by a liquid rapid solidification method; forming slices, a powder, or chops from the alloy as a raw material; and performing spark plasma sintering of the raw material at a temperature less than a recrystallization temperature of a TiNiCu shape-memory alloy.
- 9. (Withdrawn): The method for producing a rapidly solidified material consolidated into a bulk form for actuators and sensors, according to Claim 8, wherein the TiNiCu shape-memory alloy rapidly solidified material is wet-pulverized by rotary ball milling into slices, a powder, or chops.
- 10. (Withdrawn): The method for producing a rapidly solidified material consolidated into a bulk form for actuators and sensors, according to Claim 9, wherein the wet-pulverizing is

Application No.: 10/598,767

Art Unit: 1793

Amendment under 37 CFR §1.116 Attorney Docket No.: 062888

performed using an alcohol.

11. (Withdrawn): The method for producing a rapidly solidified material consolidated

into a bulk form for actuators and sensors, according to Claim 8, wherein annealing is performed

after the sintering.

12. (Withdrawn): The method for producing a rapidly solidified material consolidated

into a bulk form for actuators and sensors, according to Claim 11, wherein the crystal orientation

of alloy properties is enhanced by annealing in a magnetic field after the sintering, and the

magnetic moment (magnetic domain structure) directly relating to the magnetostriction is

controlled.
